

What does “AEGIS” mean?

(pronounced e-jiss)

Taken from Greek mythology, Aegis means “shield” or “protective cloak” which we think is an excellent depiction of what the walls and roof of a cargo trailer are supposed to do. Protect your valuable cargo from the elements and dirt. We think you will agree that the new Aegis system by Cross Trailers is a huge improvement over traditional cargo trailers.

What Does the Aegis System Do?

Everyone likes the smooth look and performance of a screwless exterior, but typical screwless walls had occasional issues with ripples and seams popping due to metal expansion as the exterior metal heated up and trailer flex during heavy use. Even single piece aluminum roofs will flex and “flap” as they age and everyone relied upon caulking products to keep the water out which would fail in time.

The **Aegis system** is changing all that with a revolutionary new mounting system that allows for flex, expansion, contraction, and isn't solely reliant upon caulk to keep the wind, dust, and water out.

Cross Trailer engineers created a system that is so innovative and such an improvement over traditional wall and roof design that Cross has decided to convert our entire product line over to this proprietary design, the Aegis System.

Aegis system

Launching Jan 1, 2019

How does it work?

Ripple Resistant Exterior Wall Panels

- ◇ Floating system, screwless, ripple resistant, technologically advanced adhesives for stronger bond to frame, increased oxidation resistance

Self Flashing Roof

- ◇ Self flashing, no wood, tighter bond to frame

Proprietary Self Flashing Extrusion

- ◇ Our new proprietary trim profile is self flashing which minimizes failures through less sealant, fewer screws, better weather seal.
